

The first two steps of the process are the most important. The first step is to identify the problem. This is done by gathering information about the problem and its causes. The second step is to analyze the problem. This is done by breaking the problem down into smaller parts and identifying the relationships between them. The third step is to develop a solution. This is done by brainstorming ideas and selecting the best one. The fourth step is to implement the solution. This is done by putting the solution into action and monitoring its progress. The fifth step is to evaluate the solution. This is done by comparing the results of the solution to the original problem and determining if the solution was successful.
